

GradeSense - Candidate Answer Sheet

Name: Rohit Das

Roll No: X-B / 31

Total marks: 15

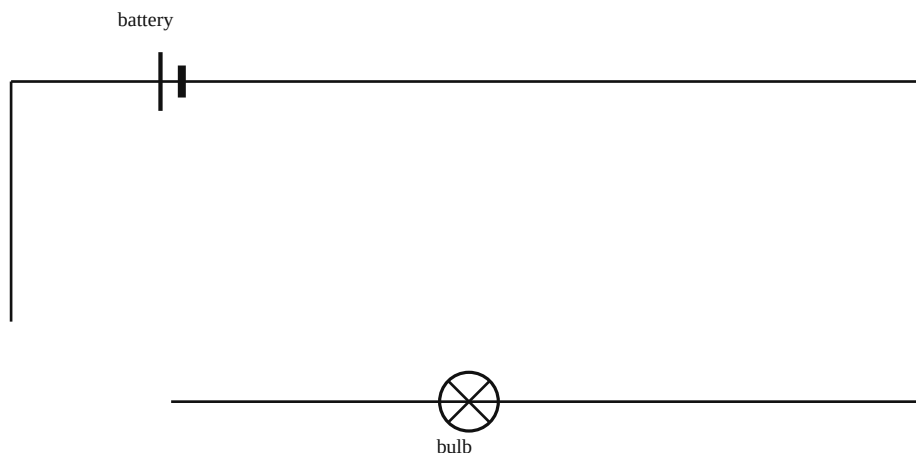

Answer 1 - Science

An electric circuit is an open path and the current jumps across the gap from one wire to the other wire. The battery stores the current inside it and then releases the current into the wires when we press the switch.

All the components must be connected in parallel, because in parallel the current is stronger. The ammeter is connected in parallel across the bulb and the voltmeter is connected in series in the main wire.

Ohm's law says that $V = I + R$. If we increase the resistance then the current also increases, because resistance pushes the current forward and makes it move faster through the bulb.

Circuit diagram

Answer 2 - English

Technology is a machine. There are many technologies like phones and computers and tablets and televisions and many other things which people use every single day in their houses and in their offices.

Some students use technology and some students do not use technology. It depends on the student and on the school and on many other different factors which are there.

Answer 3 - Economics

Both the demand curve and the supply curve slope upward, because when the price goes up everybody wants to buy more of the product and the producers also want to sell more of the product.

The equilibrium is at the price of Rs 50 and the quantity of 100 units, because that is the biggest number in the table and the market always wants the biggest quantity.

If the cost of production increases then the supply curve shifts to the right, and the equilibrium price becomes lower than it was before.
