

GradeSense - Candidate Answer Sheet

Name: Aarav Menon

Roll No: X-B / 24

Total marks: 15

Answer 1 - Science

An electric circuit is a closed path which allows the electric current to flow through it. The battery is the source which gives the potential difference to the circuit and pushes the current forward. The switch is used to make the circuit open or close. When the switch is closed the path is complete and the current flows through the bulb and the resistor, and when the switch is open the path is broken so no current can flow.

In my diagram the battery, the switch, the resistor, the bulb and the ammeter are all joined one after another in series in the main circuit. The ammeter is connected in series because it has to measure the current which is passing through the circuit. The voltmeter is also connected in series with the bulb so that it can measure the voltage across the bulb.

The current in the circuit depends on the resistance. Ohm's law is $V = IR$. If the resistance is increased and the battery voltage stays the same then less current will flow through the circuit, and if we decrease the resistance then more current will flow.

Circuit diagram

Answer 2 - English

In my opinion technology has made students very dependent on easy answers and it does not make them better learners. Earlier a student had to go to the library and search through many different books, and that whole process of searching made them think deeply about the topic. Now a student simply types the question into their phone and the answer appears in one second, so their brain does not have to do any work at all.

Students are now completely used to getting everything instantly and a lot of them cannot solve even a simple problem without looking it up first. Everybody knows that students just copy from the internet and do not learn anything, this is happening in every single school and in every single class and it is a very big problem which is making students weaker and weaker every year and the teachers all know about it also.

Some people say that technology is helpful.

So in conclusion I believe that technology is making students dependent on ready-made answers instead of making them into better learners, and students should always try to solve a problem by themselves first before they search for the answer.

Answer 3 - Economics

From the table we can see that when the price increases the quantity demanded goes down and at the same time the quantity supplied goes up. I have drawn the graph below. The demand curve slopes downward and the supply curve slopes upward.

The two curves cut each other at the price of Rs 30 and the quantity of 60 units. This is the equilibrium point of the market because at this price the quantity demanded is exactly equal to the quantity supplied, so there is no pressure on the price to change.

When the price is below the equilibrium price there is a surplus in the market, because the producers are supplying much more than what the consumers actually want to buy. When the price is above the equilibrium price there is a shortage in the market.

If the cost of production increases then the producers will not be able to supply the same quantity at the same price as before, so they will supply less at every price. Therefore the supply curve will shift towards the left side.

Demand and supply graph
